## **What to Expect Following your Drywood-Termite Treatment**

Mahalo for choosing Oahu Termite and Pest Control to service your home for Drywood Termites! There are a few important details to keep in mind post-treatment.

Once you received the all-clear, you can be assured that your structure has been properly aerated and cleared of all remaining elements. You are free to open all windows, doors, and entryways. Because Vikane Gas is non-residual and Orange Oil Plus is all-natural, you do not need to wash any clothing items, dishes, or surfaces.

## **YOU MAY SEE AN INCREASE OF INSECTS AFTER TREATMENT**

Ants, spiders, roaches, and other insects are foragers will feed on dead termite colonies, potentially kicking out existing droppings. Therefore, we recommend a comprehensive pest management program with recurring treatments to control insect populations in your home. If you do not already have a plan in place, please ask your representative to learn more about keeping your home pest free!

## **TERMITE DROPPINGS AFTER TREATMENT ARE COMMON**

Termites create passageways and tunnels as they eat through the wooden areas of a structure leaving excessive amounts of "sandy-like" droppings behind. Although drywood termites have been exterminated, these droppings may still remain in your windows, doors, walls, and trim. Any vibrations, such as the opening and closing of doors, windows and drawers, large street vehicles, and gravitational settling can displace old termite droppings. Even if you see termite droppings after your treatment, this does not mean you have an existing, live termite population.

**PLEASE CALL (808) 596-8600 FOR FURTHER INFORMATION**
